

UFOs

by

Phil Rasmussen

Between President Biden, Defense Secretary Lloyd Austin, DOD spokesperson, Admiral Kirby, and other “officials” the American public has been handed nothing but a large amount of BS over citizen concerns about the balloons that have been shot down. Members of Congress have questioned how they were shot down and the associated costs.

No matter how you look at it, UFO sightings in American air space have either been explained away, or just dropped by the government. Since Roswell a shroud of secrecy has been thrown over almost all UFO sightings.

Interestingly, though, after a classified briefing in Congress, two Congressmen have publically stated that 90% of the briefing was not relevant to national security.

Keeping that in mind and the continued response that weather and terrain conditions have made it difficult or impossible to retrieve two of the balloons shot down, this is just another load of political defecation that is dumped on the American public.

The three balloons that were shot down after the China spy balloon were said to be a danger to aircraft because of the altitudes (20 to 30 thousand feet) they were flying at. While this statement is true in one sense it is false in another. The balloons were much smaller than the Chinese one, leading defense officials to “believe” (actually stated) that they were probably private or corporate balloons, etc. However this may be correct as an amateur balloonist club announced that one of their balloons is missing. Consider that the missing balloon is a Pico Balloon K9YO balloon and is 32 inches wide. Although radar can pick up balloons of this size, the question is, how does a heat-seeking missile latch onto a balloon made of plastic? We can postulate that if the balloon was made of Mylar and was reflecting the sun toward the missile, the heat-seeking electronics could lock on.

Regardless three small balloons were shot down and according to DOD not yet retrieved. This does not make sense since the military has aircraft that can fly in “hazardous” weather and that military personnel train for all kinds of weather conditions. The coordinates of the balloons are known and helicopters can transverse the rough terrain, and military personnel can be equipped for Arctic weather conditions.

As for the size of these balloons and dismissing them as private or commercial, this is a dangerous and stupid view to take. Consider the following:

- Our enemies may be trying to find the best altitude(s) and location for their balloons to enter US airspace and avoid detection for as long as possible.
- As weapon designers, our enemies may be trying to discover which balloon shape (round, cylindrical, oblong, vertical, horizontal, etc.) and material is the least likely to be detected by radar and/or visually.
- Balloons can be easily designed to be highly maneuverable and at the same time have electronics or bombs built inside of them that would be undetectable to flybys, telescopes, and binoculars.
- By repetition, we become accustomed to things. It is like the boy crying wolf and nobody listens. The balloons may be the precursor to our becoming complacent and not taking security steps.

After all they are just harmless balloons, so we are told by government officials.

There is absolutely no reason as to why Biden and the administration cannot tell us who owned these balloons, where they came from, and in general terms, what equipment they carried. The details of the electronics with regard as to how they operated and what countermeasures they had should probably be classified, but beyond that, it is nothing more than government overreach to classify almost everything about each event.

**Demand our government to stop dumping
its excrement on us, and tell us the truth,**
